Flutter Application Name - MatchPint GitHub Repository - <https://github.com/minJerrymin/casa0015-mobile-assessment.git>

Introduction to Application

MatchPint is a Flutter mobile application designed to help football fans in London plan better match-day social experiences by connecting upcoming fixtures with suitable nearby pubs. The app addresses a common urban problem: fans often know which match they want to watch, but do not know which pubs are likely to show it, how close those pubs are, or whether the venue fits the atmosphere they want. MatchPint begins with the match rather than the venue, allowing users to browse fixtures, select a game, and receive recommended pubs based on location, sport-related tags, map information, and user comments. The application includes multiple views, including onboarding/home, match discovery, recommended pubs, pub detail pages, saved match-night planning, and settings. It uses mobile interaction patterns such as cards, bottom navigation, filters, maps, location-based discovery, and comment-based experience feedback to create a clear user journey. The project fits the Connected Environments theme by linking the user's physical context, especially location, with live urban leisure spaces and digital information about football viewing. The final version focuses on a clean, useful, and repeatable experience: users can choose an area, start with a match, compare pubs, and decide where to watch.
